Assessing Student Learning in General Education covers several case studies of good practices. The purpose of the book is explained as an outline for educators of various approaches to education. The evaluation process in education is just as variable as the methods of teaching. The book covers multiple teaching approaches and methods of evaluation while covering the challenges that ensue.

The selection of case studies in this book is based on Seymour Papert’s constructionist learning philosophy. “Papert’s philosophy was used in the context that those delivering the learning are learning about how to improve student learning when they evaluate the delivery of their teaching and evaluate the student learning.” The criteria for choosing good practices come from Astin et al.’s Nine Principles of Good Practice for Assessing Student Learning (1991) and the 1994 Association of American College publication, Strong Foundations. Each of these publications has a set of principles that determine good practices that are highlighted throughout this book.

Each case study in this book covers the following seven main topics areas:

1.  Overview of the Institutional Culture
2.  Overview of the General Education Program
3.  Overview of Assessment of the General Education Program
4.  Examples of Assessment and How Results Are Used
5.  Tips for Implementing the Process
6.  Challenges to Assessing General Education and Strategies to Overcome Them
7.  References
